Update on Irrigation and fertilization management in watermelon production in Southern Indiana

Wenjing Guan (<u>guan40@purdue.edu</u>) Vegetable specialist Clinical & Engagement Associate Professor Southwest Purdue Agricultural Center Vincennes, IN 47591 812-886-0198

Horticulture and Landscape Architecture

Watermelon Production Overview in the U.S.

Planted acres in the past three years

	2020	2019	2018
Florida	26,300	25,500	22,600
Texas	20,000	22,000	24,000
Georgia	19,000	22,000	23,000
California	9,600	9,300	12,000
North Carolina	9,000	7,800	7,700
Indiana	6,700	6,500	6,600
Arizona	4,700	5,000	NA
South Carolina	4,700	5,000	4,500

Value (1,000 dollars) of utilized production

	2020	2019	2018				
Indiana	46,898	35,294	27,915	2			
PURDUE UNIVERSITY. Horticultu Landscap		DA, NASS, Vegetables 2020 Summary					

2

Watermelon is the top specialty crop in Indiana

2020 Indiana Agriculture Overview

Watermelons are primarily grown in southern Indiana

Indiana Counties

Counties	Farms	Acres
Knox	34	4,346
Gibson	7	435
Sullivan	8	380
Jackson	6	156

2017 Census of Agriculture

PURDUE UNIVERSITY.

Overview of watermelon production

- Watermelons are primarily grown on sandy, sandy loam soils
- Seedless watermelons
- Use transplants
- Black plastic covered beds
- Wind break
- Timeline: transplanting from end April to middle June; Harvesting from middle July to Sep.

Watermelon Irrigation and Fertilization Management

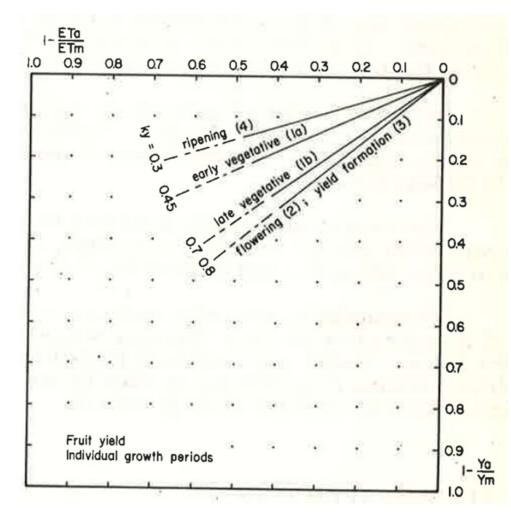

- Estimate about half the watermelon field has irrigation capability (drip irrigation or overhead irrigation)
- Estimate about half of the field that installed drip tapes use fertigation

PollEv.com/wenjingguan188

PollEv.com/wenjingguan188

Irrigation

 Vegetative period: early vegetative growth (week1-2)

late vegetative growth (vine development week 3-4)

- Flowering period (week5-6)
- Fruit filling (week7-10)
- Ripening (week10-13)

(1979. Yield response to water. Irrigation and Drainage Paper No. 33. FAO)

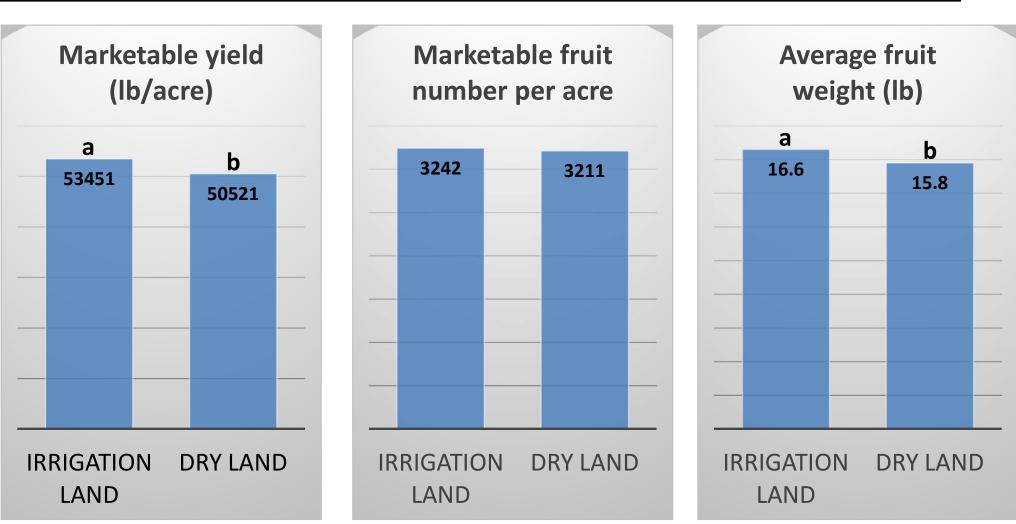

(2003. Yield response of watermelon to irrigation shortage. Scientia Horticulturae V. 98)

Dry land had smaller fruit, less yield by weight, but similar fruit number compared to the irrigated land.

Sensor-based irrigation

Table 3. Fruit yield (kg·ha⁻¹) for plants from three irrigation treatments in 2008, 2009, and 2010.^z

	Frui	t yield (kg·ha	-1)
Treatment	2008	2009	2010
WI	138,653 a ^y	100,759 a	83,862 a
MI	113,090 a	90,121 a	50,726 b
NI	77,197 b	86,578 a	46,145 b
le,			

²Experiments were conducted at the Edisto Research and Education Center, Blackville, SC.

^yWithin a column, different letters denote a significant difference (P < 0.05).

NI = not irrigated; MI = minimally irrigated; WI = well irrigated (see "Methods").

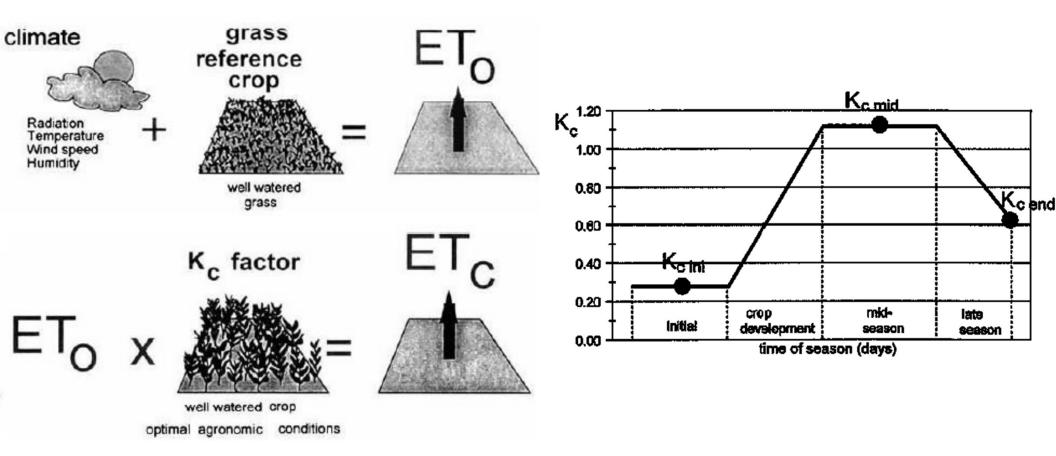

WI: soil moisture fell below 15% available water depletion MI: soil moisture fell below 50% available water depletion NI: only irrigate for early season plant establishment and fertigation Based on sensors at 12" depth

88-136 irrigation triggers in well irrigated treatment in the season. Each event was 60 min in 2008, 30 min in 2009 and 2010

Horticulture and Landscape Architecture (2013. Miller G. et al., Grafted watermelon root length density and distribution under different soil moisture ^{12/30/202}/moisture ¹⁵ treatments. HortScience)

ET-based irrigation scheduling

Horticulture and Landscape Architecture

12/30/202 | **16**

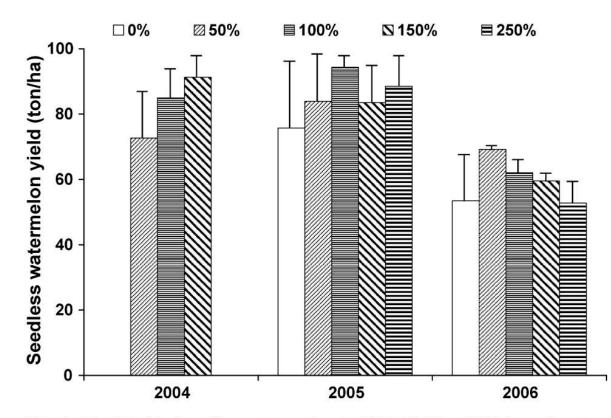

Fig. 6. Total yield of seedless watermelon in 2004, 2005 and 2006 as a function of relative irrigation rate. Error bars show standard deviation of yield.

Horticulture and Landscape Architecture 24 irrigations in 2004 and 2005, 21 irrigations in 2006. Average irrigation duration for the 100% irrigation treatment in 2004, 2005, 2006 were 4.18 h, 1.87 h, and 2.44 h.

(2007. McCann, I. et al., Effect of irrigation rate on yield of dripirrigated seedless watermelon in a humid region. Scientia Horticulturae)

Watermelon vine decline

Horticulture and Landscape Architecture

Photo credit: Dr. Dan Egel

Watermelon generally accumulate in the vegetation and fruit ---

145-160 lbs nitrogen (N) per acre 30-45 lbs phosphate (P_2O_5) per acre 160-180 lbs potassium (K_2O) per acre

(Warncke, D.D. 2007. Nutrient management for cucurbits: melons, pumpkin, cucumber, and squash. 2007 Indiana CCA Conference Proceedings)

Adjustments in nitrogen

Situation	N Rate adjustment
Legume cover crop	Subtract 40 to 60
Compost, 2 ton/acre	Subtract 20 to 25
Cereal Grain cover crop, < 8 inches	No change
Cereal Gain cover crop, > 8 inches	Add 20
Corn grain as previous crop	Add 20-30
Wheat grain as previous crop	Add 30-40
Soil Organic matter, <2 %	Add 20
SOM, 2-4%	No change
Soil Organic Matter, >4 %	Subtract 20

(Warncke, D.D. 2007. Nutrient management for cucurbits: melons, pumpkin, cucumber, and squash. 2007 Indiana CCA Conference Proceedings)

Watermelon N experiment in 2021 at SWPAC

- Soil and field history: OM 0.7%; Planted wheat in 2020
- Treatment (N: Urea) Trt I: 75 lbs/acre N (preplant broadcast) + 75 lbs/acre N (in-season topdressing)

Trt 2: 100 lbs/acre N (preplant broadcast) Trt 3: 150 lbs/acre N (preplant broadcast) Trt 4: 200 lbs/acre N (preplant broadcast) Trt 5: 250 lbs/acre N (preplant broadcast)

• 6' bed spacing, 4' in-row spacing

Each experiment plot comprised two rows, 6 plants per row, 12 plants per experimental plot

20 (W) x 28 (L) area

Randomized complete block design, four blocks

Fertilizers were applied by hand

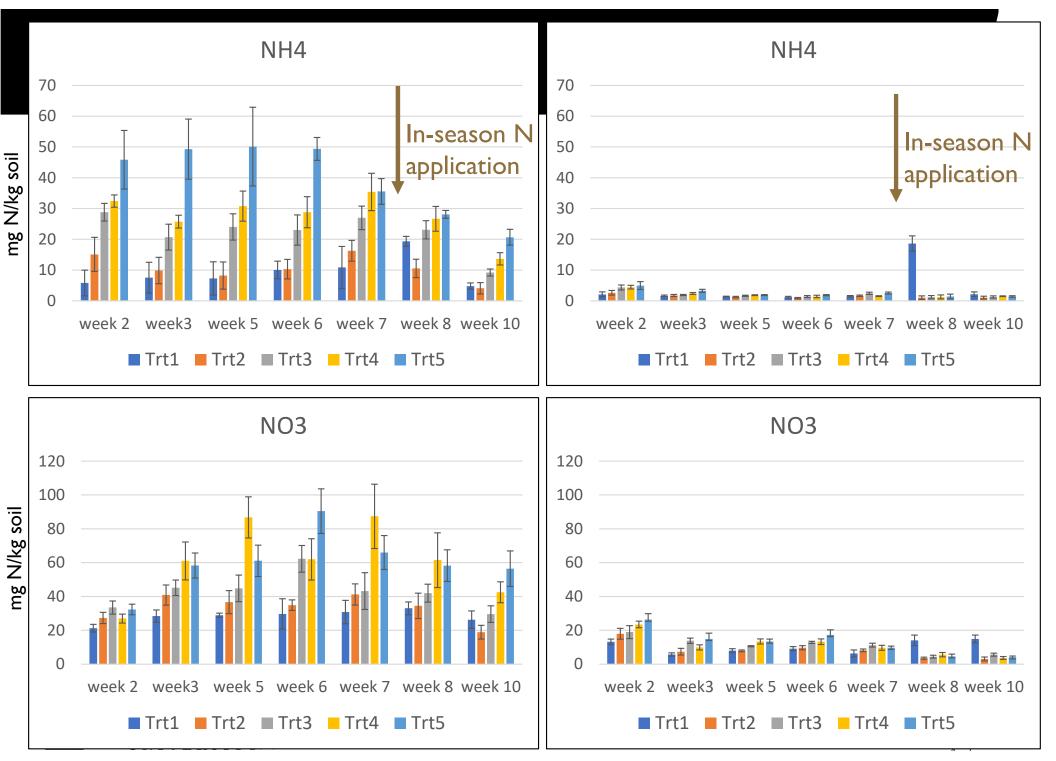

Soil NO₃-N and NH₄-N were measured in soils taken from mulch-covered beds and row middles (bare soil)

Plant tissue samples were collected for nutrient content measurement during the season

Horticulture and Landscape Architecture

Soil samples from mulch-covered beds

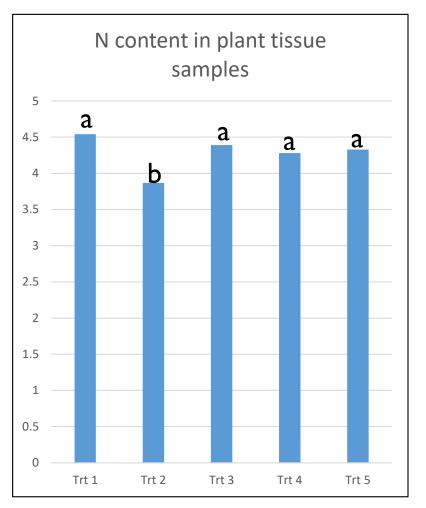

Soil samples from row middles

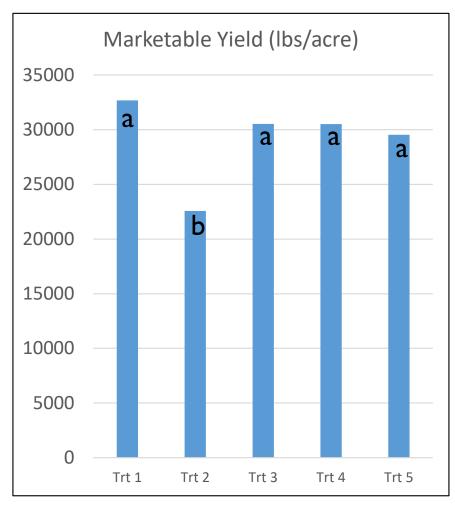

Leaf damage was observed after in-season Urea application on Trt I

Horticulture and Landscape Architecture

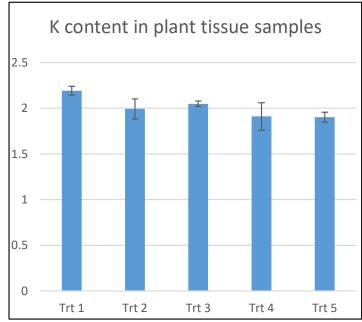

Tissue samples were collected in week 13 (harvest)

Other factors may have limited yield

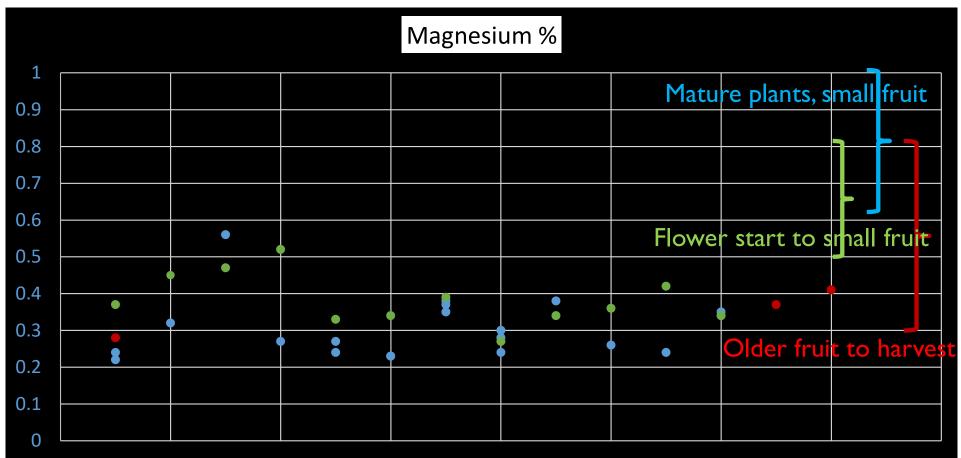

- Average pH from experimental plots dropped from 6.6 at the beginning of the season to 5.5 at the end of the season
- Plant tissue test found K, Mg and S were generally at low or deficient levels across the treatments

All the treatments received I 00 lbs K/acre and 30 lbs Mg/acre in the forms of potash and K-Mag

Magnesium levels were generally low or deficient in watermelons in southern Indiana

Horticulture and Landscape Architecture Reference: Bryson et al., Plant Analysis Handbook III

28

Watermelon Mg and S experiment in 2021 at SWPAC

- I 50 lbs N/acre with urea, I 00 lbs K/acre with potash or K-Mag
- Treatment: Trt I: K-Mag (Mg 30 lbs/acre; S

65 lbs/acre)

Trt 2: no K-Mag

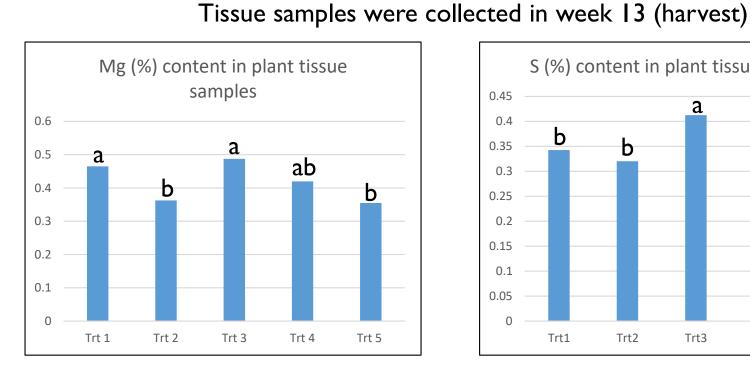

Trt 3: no K-Mag, foliar spray

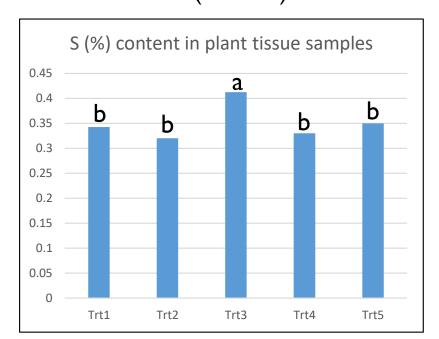

epsom salt

Trt 4: no K-Mag, foliar spray Max-IN [®]Magnesium (6% N, 5% Mg) Trt 5: no K-Mag, S 65 lbs/acre using gypsum

Foliar sprays were conducted five times during the season (week 9, 10, 11, 12, 13) Application rate-

Empson salt (9%Mg, I 3%S): I lb Mg/acre Max IN Magnesium: 3 quarts per acre (label)

Yields were similar among treatments ۲
